

Passenger Separation features

What is it?

- Lift control features that help a building to control social distancing in relation to passenger lifts.

Feature: APB

A simple update which provides for only one landing or car call to be accepted at a time, thereby helping to reduce the number of passengers in the lift at any one time.

- Available on TVC Ethos simplex, duplex and group control systems
- TVC controllers can be retrospectively modified.

Feature: One-Way Traffic / Split Group Control

Splitting a TVC Ethos Group system to separate incoming and outgoing lifts e.g.

- Split lifts into inward/upward traffic and outward/downward traffic so that the building can have separate in/out pathways at the access floor.
- Applications include hospital lift groups where it is desirable to physically separate potentially infected incoming patients from outgoing visitors and patients.
- Can be retrofitted to existing TVC Ethos groups or as an option on new installations.
